### Aqua2018 – Aliga Microalgae Booth #44 -

Aliga microalgae is a Danish based company specializing in producing high quality, nutrient-rich and bio-secure microalgae concentrated paste for hatcheries worldwide. To meet these hatcheries' stringent demands, Aliga has developed the Aquapaste® product range.

The Aquapaste is a prepacked, off-the-shelf, concentrated microalgae-paste with nutritive profiles that provide live prey, larvae and juveniles with the necessary protein, vitamin and essential fatty acid enrichment during their first period in life. Aquapaste has the characteristics and attributes of fresh, live microalgae when poured into culture tanks due to the paste's high cell integrity, absolute single cell dispersity and great water column buoyancy. Together with easy handling of the prepacked product, Aquapaste provides instant nutritional microalgae to hatcheries which can substitute on-site cultivated microalgae cultures that often are used.

The Aquapaste is offered as fresh or frozen concentrated paste that, for easy handling, bio-security and long shelf-life, is prepacked in 1-litre poly-nylon vacuum bags which preserve the paste in line with FDA standards. When poured into culture tanks or Green Water systems, the paste disperses easily and its cells remain for longer in the water column in comparison with many other products offered on the market today.

As a company we always strive to offer our customers exceptional value through a combination of competitive pricing, enhanced service and products of the highest quality.
