EVALUATION OF JUVENILE AUSTRALIAN RED CLAW CRAYFISH Cherax quadricarinatus FED PRACTICAL DIETS WITH AND WITHOUT SUPPLEMENTAL LECITHIN AND/OR CHOLESTEROL.

Red claw crayfish (Cherax quadricarinatus) are one of more than a hundred species of Australian freshwater crayfish. However, because of its rapid growth rate, ease of spawning, wide temperature and dissolved oxygen tolerance, and lack of a larval stage, red claw may be the best candidate for a United States. Red claw are only being investigated as an aquaculture species in the country as existing information exists on their nutritional requirements and practical diet formulations. Many crustaceans require lecithin and cholestrol to be added to their diet, these two nutrients are expensive and lecithin and cholesterol are very expensive. Since diet costs can be as much as 40% of the total expenses for an aquaculture enterprise, it is imperative that the least expensive diet formulations be determined. The present study was conducted to examine the effects of growth performance of newly-hatched juvenile red claw fed practical diets with or without cholesterol and lecithin. Other practical diets included menhaden fish meal, soybean meal, shrimp meal, wheat flour, vitamin and mineral mix, pellet binder, cod liver oil, and corn oil (Table 1).

After 8 weeks, red claw crayfish fed a practical diet without cholesterol (Diets 3) had significantly (P<0.05) lower final weight, percentage weight gain, and specific growth rate (SGR) compared to crayfish fed all other diets (Table 2). These results indicate that a practical diet containing 2% cod liver oil and 1% corn oil and having no lecithin appears to be sufficient and that lecithin may not be necessary for juvenile red claw diets.
