AN OVERVIEW OF THE STRATEGIES AND AGENDA FOR PROMOTING SUSTAINABLE AQUACULTURE DEVELOPMENT ON THE CONTINENT

A significant number of Africa's countries heavily depend on fish as sources of animal protein and revenue. The rate of population growth is placing serious demand on the available fish supplies, which by account has become stagnant during the last decade. Current estimates are stating that most commercially exploited wild fish populations are either overexploited or fully exploited. Africa has an estimated population of 1.6 billion people. The continent's current food fish supply is estimated at about 9 kg per capita per annum while the global average has risen to approximately 20 kg per capita per annum. The likelihood that capture fishery production can significantly be increased over the next 20 years to meet demand is low because most of the commercially important fish stocks are reported to be fully exploited or overexploited. It is not a surprise therefore that over past five years Africa has become a net importer of fish. Aquaculture currently provides the most sustainable option for the continent to expand its fish production. However, despite growth in the sector, African aquaculture only contributes to 2% of global aquaculture production.

The Joint Conference of Africa ministers of agriculture, rural development and fisheries and aquaculture in 2014 recognized the potential of the aquaculture sector to generate wealth, social benefits and contribute to the development of the African economy and contribute to global Sustainable Development Goals. The Policy Reform Strategy for Fisheries and Aquaculture (PFRS), aims to create this transformation in aquaculture through facilitating the conditions for market-led sector development. Several challenges need to be overcome if the continent is to meet its benchmarks for sustainable commercial aquaculture development. This paper discusses at continental level the actions currently being undertaken to support the appropriate policy reforms for sustainable commercial aquaculture development on the continent.

2. N. Isyagi, M. Seisay, S. Noaula, O. Anozie and H. Moepi, AU-IBAR
A SYNTHESIS OF REGIONAL ENVIRONMENTAL ISSUES AND APPROACHES FOR SUSTAINABLE ENVIRONMENTAL MANAGEMENT TO SUPPORT SUSTAINABLE COMMERCIAL AQUACULTURE DEVELOPMENT IN AFRICA. B

Aquatic ecosystems provide several goods and services including fisheries and aquaculture production. Aquatic ecosystems are also the ultimate recipients of pollution from human activity, including from aquatic production practices, industrial and municipal activities. Aquatic production systems too can have significant environmental and social adverse impacts. The productivity of aquatic production systems, aquaculture notwithstanding, depends on the status of aquatic resources, environmental pollution and habitat degradation. Aquatic resources are generally considered renewable. However, even while this might be so, they are not infinite. They need to be properly managed if their contribution to nutrition, economic and social well-being of the growing world's population is to be sustained.

The Policy Framework and Reform Strategy for Fisheries and Aquaculture in Africa (PFRS) advocates for the sustainable management and conservation of aquatic resources to ensure sustainable fisheries and aquaculture development. The FAO Code of Conduct for Responsible Fisheries encompasses this approach. The paradigm of this is enshrined in the ecosystem approach to aquaculture. The ecosystem approach to aquaculture (EAA) is a strategy for the integration of the aquaculture within the wider ecosystem so as to ensure sustainable development, equity and resilience of interlinked social-ecological systems. In line with these, several African Member states require that environmental impact assessments are part of the requirements for approval of large commercial aquaculture projects. However, it is the continent's overall objective and the objective Member States to expand commercial aquaculture to the level whereby aquaculture becomes a major contributor to fish production, source a

For sustainable aquaculture development at this level, there is need to develop and implement strategic sectoral environment management approaches that do not just focus at the farm but also factor in the wider environment. This is necessary because in practice, aquaculture is dependent upon the entire ecosystem. For example, at geographical level, a cluster of farms that share a common waterbody or watershed need coordinated management. Exotic fish that escape from fish farms have impacts across the entire watershed; so do the external drivers of aquaculture such as population growth and development, trade and climate change. Watershed boundaries, trade and climate change transcend national boundaries.

Sustainable aquaculture development founded transboundary initiatives that are coherent supporting the sustainable use of aquatic resources coupled with climate change adaptation. Such an approach will enable member states make more realistic and appropriate aquaculture development plans, approve appropriate projects and institute environmental management assessments more effectively.

3. N. Isyagi, M. Seisay, S. Noaula, O. Anozie and H. Moepe, AU-IBAR THE CONTINENTAL OVERVIEW AND APPROACHES FOR AQUATIC ANIMAL DISEASE CONTROL

The Policy Framework and Reform Strategy for Fisheries and Aquaculture in Africa seek to create the enabling conditions for increased the sector's contribution to food and nutrition security, livelihoods and economic growth in Africa. To this end AU-IBAR, in collaboration with the NEPAD Agency and with support from EU, is implementing the Fisheries governance Project whose aim is to improving the institutional and policy environment for sustainable management and utilization of fisheries and aquaculture resources in Africa as among the avenues for achieving the sectoral continental objectives.

Attaining these goals entails increasing levels of production and improving access of fish produce and products to market. The success of this hinges upon the production systems employed and ensuring that environmental, food quality and safety issues are addressed. The status of aquatic animal health and therefore the control and surveillance of fish diseases is among the most important determinants for productivity, viability, environmental biosecurity, food safety and quality from the fishery and commercial aquaculture production systems. Consequently, one of the cardinal activities identified for sustainable aquaculture development and the transformation of the fisheries is enhancing capacities for Fisheries diseases surveillance and control, timely collection, analysis and sharing of accurate sanitary information by strengthening the capacity of National veterinary services for early detection, timely notification/reporting, prevention and control of fish diseases.

Currently however, the capacity for aquatic animal veterinary services for fish diseases identification, surveillance and control in most AU member states is grossly inadequate. The benefits of maintaining the upper-hand over disease conditions through effective aquatic animal disease control are obvious, notably prevention of serious obligate diseases and/or the importation of exotic diseases, increased farm production and efficiency, access to markets (quality assurance and certification) and economic benefits (to the producer, community and nation).

Consequently one of the major activities under the result Institutional capacity and regulatory frameworks for sustainable fisheries management of the Fisheries Governance Project is enhancing capacities for fish diseases surveillance and control, timely collection, analysis and sharing of accurate sanitary information on the continent. This has involved undertaking disease mapping studies to obtain a baseline of the status quo for both endemic and notifiable diseases, training for fisheries and veterinary managers, development of regional disease control frameworks and aquatic animal health networks. This presentation gives and overview of these actions and their prospective benefits.
